

# Wireless Products General

**I would like to use my 5900/5902/5903/5910/5911 with my new Multiverse QolorPoint 7000. How do I get the two to connect in the 2.4 range?**

QolorPoints will work with 5902 MV Nodes and 5900 MV SHoW Baby in both Neo SHoW IDs and Multiverse SHoW IDs. They will work with the 5910 and 5911 MV Transmitters in Multiverse SHoW IDs only. In order to set a Multiverse ID on a QolorPoint fixture, you need to RDM to fixture.

You will need to set the 5900 Show Baby or 5902/5903 Multiverse Node to a Neo SHoW IDs such as:

Green - 201

Cyan - 102

Magenta - 117

White - 133

Red - 149

Yellow - 165

In order to use a 5910/11 you first need to establish an RDM connection to the fixture wirelessly using a SHoW Baby (5900) or a Multiverse Node (5902/3). Then you change the SHoW ID in the fixture to a Multiverse SHoW ID (24000-24355). Once changed, match the ID in the transmitter settings and the fixture should begin to listen to the Multiverse Trnasmmitter. The ID LED should be blue.

Unique solution ID: #1131
